MATH - 4360: Linear Statistical Models

Chapter 3 - Some Results on Linear Algebra and Matrix Theory

Suthakaran Ratnasingam

Vectors

A vector Y is an ordered n-tuple of real numbers. A vector can be expressed as a row vector or a column vector as

$$Y = \begin{pmatrix} y_1 \\ y_2 \\ \vdots \\ y_n \end{pmatrix}_{n \times 1}$$

is a column vector of order $n \times 1$ and

$$Y' = (y_1, y_2, \ldots, y_n)_{1 \times n}$$

is a row vector of order $1 \times n$.

Shortcut!

```
rm(list = ls())
library(ggplot2)
library(Matrix)
library(psych)
library(pracma)
z = c(10, 26,  9,  8,  4) # row vector
Z = matrix(z) # convert into a column vector
Z
```

```
##      [,1]
## [1,]   10
## [2,]   26
## [3,]    9
## [4,]    8
## [5,]    4
```

```
as.vector(Z) # convert a column vector into a row vector
```

```
## [1] 10 26  9  8  4
```

If

$$X = \begin{pmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{pmatrix}$$

$$Y = \begin{pmatrix} y_1 \\ y_2 \\ \vdots \\ y_n \end{pmatrix}$$

$$Z = \begin{pmatrix} z_1 \\ z_2 \\ \vdots \\ z_n \end{pmatrix}$$

Then,

$$X + Y = \begin{pmatrix} x_1 + y_1 \\ x_2 + y_2 \\ \vdots \\ x_n + y_n \end{pmatrix}$$

$$kY = \begin{pmatrix} ky_1 \\ ky_2 \\ \vdots \\ ky_n \end{pmatrix}$$

```
x = c(7,  2,  7, 30,  5) # row vector
y = c(7,  3,  3,  4,  6) # row vector
X = matrix(c(7,  2,  7, 30,  5), ncol = 1) # column vector
X
```

```

```

Matrix

A matrix is a rectangular array of real numbers. For example

$$A = \begin{pmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{m1} & a_{m2} & \dots & a_{mn} \end{pmatrix}$$

is a matrix of order $m \times n$ with m rows and n columns.

```
a = c(7,  3,  3,  4,  6,  7,  2,  7, 30,  5, 16, 10)
# Let's create 4 by 3 matrix
A = matrix(c(7,  3,  3,  4,  6,  7,  2,  7, 30,  5, 16, 10), ncol = 4, nrow = 3)
A
```

```
##      [,1] [,2] [,3] [,4]
## [1,]    7    4    2    5
## [2,]    3    6    7   16
## [3,]    3    7   30   10
```

If $m = n$, then A is called a square matrix.

```
a = c(7,  3 , 3 , 4,  6,  7,  2,  7, 30,  5, 16, 10,  4,  6,  9, 10,  6,  7,  3, 17, 10, 26,  9,  8,  4)
# For example m = n = 5
A = matrix(a, ncol = 5, nrow = 5)
A
```

```
##      [,1] [,2] [,3] [,4] [,5]
## [1,]    7    7   16   10   10
## [2,]    3    2   10    6   26
## [3,]    3    7    4    7    9
## [4,]    4   30    6    3    8
## [5,]    6    5    9   17    4
```

The diagonal elements of A can be obtained using the `R` function `diag()`

```
diag(A)
```

```
## [1] 7 2 4 3 4
```

If $a_{ij} = 0,\ i \neq j,\ m = n$ then A is a diagonal matrix and is denoted as

$$A = \mathrm{diag}(a_{11}, a_{22}, \dots, a_{mm})$$

```
diag(c(560,  220,  340,   80,  150 ))
```

```
##      [,1] [,2] [,3] [,4] [,5]
## [1,]  560    0    0    0    0
## [2,]    0  220    0    0    0
## [3,]    0    0  340    0    0
## [4,]    0    0    0   80    0
## [5,]    0    0    0    0  150
```

Null Matrix: A matrix whose all elements are equal to zero is called a null matrix.

```
O = matrix(0, nrow = 3, ncol = 3)
O
```

```
##      [,1] [,2] [,3]
## [1,]    0    0    0
## [2,]    0    0    0
## [3,]    0    0    0
```

Identity Matrix: The identity matrix of size n is the $n \times n$ square matrix with ones on the main diagonal and zeros elsewhere. We can write

$$I_n = \mathrm{diag}(1, 1, \dots, 1)$$

```r
I=diag(5)
I
```

```
##      [,1] [,2] [,3] [,4] [,5]
## [1,]    1    0    0    0    0
## [2,]    0    1    0    0    0
## [3,]    0    0    1    0    0
## [4,]    0    0    0    1    0
## [5,]    0    0    0    0    1
```

If $m = n$ (square matrix) and $a_{ij} = 0$ for $i > j$, then A is called an upper triangular matrix. On the other hand if $m = n$ and $a_{ij} = 0$ for $i < j$ then A is called a lower triangular matrix.

```r
a = c(7,  3 , 3 , 4,  6,  7,  2,  7, 30,  5, 16, 10,  4,  6,  9, 10,  6,  7,  3, 17, 10, 26,  9,  8,  4)
A = matrix(a, ncol = 5, nrow = 5)
A
```

```
##      [,1] [,2] [,3] [,4] [,5]
## [1,]    7    7   16   10   10
## [2,]    3    2   10    6   26
## [3,]    3    7    4    7    9
## [4,]    4   30    6    3    8
## [5,]    6    5    9   17    4
```

```r
triu(A) # upper triangular
```

```
##      [,1] [,2] [,3] [,4] [,5]
## [1,]    7    7   16   10   10
## [2,]    0    2   10    6   26
## [3,]    0    0    4    7    9
## [4,]    0    0    0    3    8
## [5,]    0    0    0    0    4
```

```r
tril(A) # lower triangular
```

```
##      [,1] [,2] [,3] [,4] [,5]
## [1,]    7    0    0    0    0
## [2,]    3    2    0    0    0
## [3,]    3    7    4    0    0
## [4,]    4   30    6    3    0
## [5,]    6    5    9   17    4
```

Symmetric Matrix: If $A = A'$ then A is a symmetric matrix.

```r
a = c(1, 7, 3, 7, 4, 5, 3, 5, 6)
A = matrix(a, ncol = 3, nrow = 3)
A
```

```
##      [,1] [,2] [,3]
## [1,]    1    7    3
## [2,]    7    4    5
## [3,]    3    5    6
```

```r
# Let's find transpose of A
t(A)
```

```
##      [,1] [,2] [,3]
## [1,]    1    7    3
## [2,]    7    4    5
## [3,]    3    5    6
```

Skew-Symmetric Matrix If $A = -A'$ then A is skew-symmetric matrix.

```r
a = c(3, 2, -5, -2, 3, -4, 5,  4, 3)
A = matrix(a, ncol = 3, nrow = 3, byrow = TRUE)
A
```

```
##      [,1] [,2] [,3]
## [1,]    3    2   -5
## [2,]   -2    3   -4
## [3,]    5    4    3
```

```
# Let's find transpose of A
t(A) # Not symmetric
```

```
##      [,1] [,2] [,3]
## [1,]    3   -2    5
## [2,]    2    3    4
## [3,]   -5   -4    3
```

```
# Let's find (-A)'
A_neg = -A
t(A_neg) # (-A)' = A
```

```
##      [,1] [,2] [,3]
## [1,]   -3    2   -5
## [2,]   -2   -3   -4
## [3,]    5    4   -3
```

If A and B are matrices of order $m \times n$ then $(A + B)' = A' + B'$

```
a = c(7,  3 , 3 , 4,  6,  7,  2,  7, 30)
A = matrix(a, 3, 3)
A
```

```
##      [,1] [,2] [,3]
## [1,]    7    4    2
## [2,]    3    6    7
## [3,]    3    7   30
```

```
At = t(A)
At
```

```
##      [,1] [,2] [,3]
## [1,]    7    3    3
## [2,]    4    6    7
## [3,]    2    7   30
```

```
b = c(5, 16, 10,  4,  6,  9, 10,  6,  7)
B = matrix(b, 3, 3)
B
```

```
##      [,1] [,2] [,3]
## [1,]    5    4   10
## [2,]   16    6    6

Trace of a Matrix

The trace of $n \times n$ matrix A , denoted as $tr(A)$ or $tr(A)$ is defined to be the sum of all the diagonal elements of A, i.e.

$$tr(A) = \sum_{i=1}^{n} a_{ii}$$

```
# Create a 3 by 3 matrix
a = c(7,  3 , 3 , 4,  6,  7,  2,  7, 30)
A = matrix(a, 3, 3)
A
```

```
##      [,1] [,2] [,3]
## [1,]    7    4    2
## [2,]    3    6    7
## [3,]    3    7   30
```

```
# trace of A
tr(A)
```

```

Rank of Matrices

The rank of a matrix A of $m \times n$ is the number of linearly independent rows in A. Let B be any other matrix of order $n \times q$.

1. A square matrix of order m is called **non-singular** if it has full rank. $rank(AB) \leq \min\{rank(A), rank(B)\}$
2. $rank(A + B) \leq rank(A) + rank(B)$
3. $rank(A)$ is equal to the maximum order of all nonsingular square sub-matrices of A.
4. $rank(AA') = rank(A'A) = rank(A) = rank(A')$.
5. A is of full row rank if $rank(A) = m < n$.

6. A is of full column rank if $rank(A) = n < m$

We will use the r function qr()

```
# A is a 4 by 3 matrix
a = c(7,  3 , 3 , 4,  6,  7,  2,  7, 30, 5, 16, 10)

The determinant of a matrix

The determinant of a matrix is a scalar value that is a function of the entries of a square matrix. The determinant of a matrix A is denoted $det(A)$ or $|A|$.

1. For a 2×2 matrix

$$det(A) = \begin{vmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{vmatrix} = (a_{11}a_{22} - a_{12}a_{21})$$

2. For a 3×3 matrix

$$det(A) = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} = a_{11} \begin{vmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{vmatrix} - a_{12} \begin{vmatrix} a_{21} & a_{23} \\ a_{31} & a_{33} \end{vmatrix} - a_{12} \begin{vmatrix} a_{21} & a_{22} \\ a_{31} & a_{32} \end{vmatrix}$$

```
# A is a 2 by 2 matrix
a = c(7,  3 , 3 , 4)
A = matrix(a, 2, 2, byrow = TRUE) # Matrix A
A
```

```
##      [,1] [,2]

Inverse of a Matrix

The inverse of a square matrix A of order m, is a square matrix of order m, denoted as A^{-1}, such that $A^{-1}A = AA^{-1} = I_m$. The inverse of A exists if and only if A is non-singular. For a 2×2 matrix

$$A = \begin{pmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{pmatrix}$$

the matrix inverse is

$$A^{-1} = \frac{1}{det(A)} \begin{pmatrix} a_{22} & -a_{12} \\ -a_{21} & a_{11} \end{pmatrix}$$

where $det(A) = (a_{11}a_{22} - a_{12}a_{21})$

```
# A is a 4 by 4 matrix
a = c(7,  3 , 3 , 4,  6,  7,  2,  7, 30, 5, 16, 10, 15.5, 23.75,  8, 17)
A = matrix(a, 4, 4) # Matrix A
A
```

```

Idempotent Matrix

A square matrix A is called idempotent if $A^2 = AA = A$. If A is an $n \times n$ idempotent matrix with $rank(A) = r < n$. Then

1. eigenvalues of A are 1 or 0.
2. $tr(A) = rank(A) = r$
3. If A is of full rank n, then $A = I_n$.
4. If A and B are idempotent and $AB = BA$, then AB is also idempotent.
5. If A is idempotent then $(I - A)$ is also idempotent and $A(I - A) = (I - A)A = 0$

```
#  A is a 3 by 3 matrix

Quadratic Forms

If A is a given matrix of order $m \times n$ and X and Y are two given vectors of order $m \times 1$ and $n \times 1$ respectively

$$X'AY = \sum_{i=1}^{m} \sum_{j=1}^{n} a_{ij} x_i y_j$$

where a_{ij} are the nonstochastic elements of A

1. If A is a square matrix of order m and $X = Y$, then

$$X'AX = a_{11}x_1^2 + \cdots + a_{mm}x_m^2 + (a_{12} + a_{21})x_1x_2 + \cdots + (a_{m-1,m} + a_{m,m-1})x_{m-1}x_m$$

2. If A is symmetric also, then

$$X'AX = a_{11}x_1^2 + \cdots + a_{mm}x_m^2 + 2a_{12}x_1x_2 + \cdots + 2a_{m-1,m}x_{m-1}x_m = \sum_{i=1}^{m} \sum_{j=1}^{n} a_{ij} x_i x_j$$

is called a quadratic form in m variables $x_1, x_2, \ldots, x_m$ or a quadratic form in X.

```
x = c(10, 26,  9,  8,  4) # row vector
X = matrix(x) # column vector
X
```

```

```

```
Quadratic = t(X) %*% A %*% X  # X'AX
Quadratic
```

```
##       [,1]
## [1,] 25776
```

Note

1. Positive definite if $A'AX > 0$ for all $X \neq 0$
2. Positive semidefinite if $A'AX \geq 0$ for all $X \neq 0$.
3. Negative definite if $A'AX < 0$ for all $X \neq 0$.
4. Negative semidefinite if $A'AX \leq 0$ for all $X \neq 0$.
5. If P is any nonsingular matrix and A is any positive definite matrix (or positive semi-definite matrix) then $P'AP$ is also a positive definite matrix (or positive semi-definite matrix).
6. A matrix A is positive definite if and only if there exists a non-singular matrix P such that $A = P'P$.

7. A positive definite matrix is a nonsingular matrix.
8. If A is $m \times n$ matrix and $rank(A) = m < n$ then AA' is positive definite and $A'A$ is positive semidefinite.
9. If A is $m \times n$ matrix and $rank(A) = k < m < n$, then both $A'A$ and AA' are positive semidefinite.

Orthogonal Matrix

A square matrix A is called an orthogonal matrix if $A'A = AA' = I$ or equivalently if $A^{-1} = A'$

1. An orthogonal matrix is non-singular.
2. If A is orthogonal, then AA' is also orthogonal.
3. If A is an $n\times$ matrix and let P is an $n \times n$ orthogonal matrix, then the determinants of A and $P'AP$ are the same.

Random Vectors

Let $Y_1, Y_2, \ldots, Y_n$ be n random variables then $Y = (Y_1, Y_2, \ldots, Y_n)'$ is called a random vector.

1. The mean vector Y is

$$E(Y) = (E(Y_1), E(Y_2), \ldots, E(Y_n))'$$

2. The covariance matrix or dispersion matrix of Y is

$$Var(Y) = \begin{pmatrix} Var(Y_1) & Cov(Y_1, Y_2) & \cdots & Cov(Y_1, Y_n) \\ Cov(Y_2, Y_1) & Var(Y_2) & \cdots & Cov(Y_2, Y_n) \\ \vdots & \vdots & \ddots & \vdots \\ Cov(Y_n, Y_1) & Cov(Y_n, Y_2) & \cdots & Var(Y_n) \end{pmatrix}$$

which is a symmetric matrix.

1. If $Y_1, Y_2, \ldots, Y_n$ are independently distributed, then the covariance matrix is a diagonal matrix
2. If $Var(Y_i) = \sigma^2$ for all $i = 1, 2, \ldots, n$ then $Var(Y) = \sigma^2 I_n$
